DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 20-23 and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Barlow (U.S. Pub. No. 20010005797) and further in view of Sherwood (U.S. Pub. No. 2003/0114936).

Consider claims 20-23 and 25, Barlow teaches the making of three-dimensional geometric shapes by fusing layers of calcium phosphate mixed with polymer binders. (abstract and claim 25) The structure is formed by using a binder coated calcium phosphate powders, whereby dissolving the polymer (considered to include methyl methacrylate (Para. 79)) in a suitable organic solvent (aqueous liquid) (considered to include water (Para. 77), which is also considered to give a low molecular weight polymer) and then depositing the solution on the surface of the particulate, then evaporating the solvent (hardening). (Para. 68)

The calcium phosphate is considered to include hydroxyapitate. (Para. 66)

Additionally, the structure is considered to retain its form upon drying because Barlow states that the process of fabrication of these bone geometries is complex and that that

Art Unit: 1775

process allows an accurate copy of the complex bone structure, which would not be possible if the composition did not retain its size and form upon drying. (Para. 75)

However, Barlow teaches an average pore size down to 50 microns, but
Sherwood, who teaches solid three-dimensional structures (abstract) that can be
formed by a three-dimensional ink-jet process where the particles maybe made of one
or more ceramic or other inorganic substances such as hydroxyapatite and other
calcium phosphates (Para.136), in addition to the particles also being polymers. (Para.
73) Sherwood also teaches the use of a binder, specifically poly acrylic acid (PAA),
which is capable of binding powder particles together and to other solid regions, which
can be contained in an aqueous solution. (Para. 84) Additionally, Sherwood teaches
the ability to teach a surface porosity of less than 10 microns. (Para. 160) It would
have been obvious to a person of ordinary skill in the art at the time of the invention to
combine the making of the three-dimensional shapes of Barlow with the threedimensional shapes with the smaller porosity of Sherwood to assisting in the prevention
of delamination in the transition region. (Sherwood, abstract)

Response to Arguments

Applicant's arguments, filed 7/5/2007, with respect to the rejection using 35 U.S.C. 102 ((b), but which should have been (a)) have been fully considered and are persuasive. The rejection of Sherwood utilizing 35 U.S.C. 102 (b)), but which should have been (a)) has been withdrawn.

Applicant's arguments filed 7/5/2007 have been fully considered but they are not persuasive in regard to the 35 U.S.C. 103(a) rejection of Barlow in view of Sherwood.

Application/Control Number: 10/650,571 Page 4

Art Unit: 1775

While the applicant is correct that Sherwood also teaches the use of pores that are greater 100 microns, the applicant's claim limitation does not necessarily teach against the having of 100 micron sized pore. Because the applicant states that the pore sizes are no larger that about 10 microns on average, this is interpreted to mean that the pores can be virtually any size (e.g. as high as 200 microns and as low as .001 microns), so long as the average is about 10 microns. While Sherwood does not state that the average size of the pores is 10 microns, Sherwood is considered to make it obvious to use 10 micron sized pores and less in solid three-dimensional structures (abstract) that can be formed by a three-dimensional ink-jet process.

Application/Control Number: 10/650,571

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Gordon R. Baldwin whose telephone number is (571)272-5166. The examiner can normally be reached on M-F 7:45-5:15.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jennifer McNeil can be reached on 571-272-1540. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
